I knew there is an answer,

I was just unsure where...

logs_fdw?

Parsing???

THANK YOU GILLS DAROLD!!!

DRW

Now we are ready to present...

New pgBadger Magic!

pgBadger New Level

10

What will be covered

- Changes made to pgBadger by Gills Darold
- How we can use it
- Logs processing automation
- Load Example
- Problem-solving example
- Logs processing by the numbers
- What's next?

pgBadger New Level

New pgBadger features

New pgBadger options

--dump-raw-csv – produces
parsed log, in a csv format

--csv-separator – assigns separator different
from ‘,’

```
pgbadger /Users/hettie/chocolate.log --dump-raw-csv --csv-separator # >  
chocolate.csv
```

Loading csv into Postgres database

```
SELECT * FROM  
CHOCOLATE_LOG
```

	sqlstate	duration	query

How can we use this table?

- Session tracing
- Tracing events which happened at the same time
- Performance dynamics
- Precise access control

pgBadger New Level

Design Details

Log_id and Partitioning

- Why we need log_id
- Partitioning
- Problems
- Reload
- Further partitioning
- Building log_id

```
log_id bigserial  
partition by range(log_sample)  
what if we miss one log file?!  
we do not want duplicates!  
partition by list  
(log_timestamp)  
(epoch::bigint)*1000000000+  
(row_number() over ())
```

Indexing

- Obvious indexes:
 - PK: log_id, log_sample, log_timestamp
- Obvious non-indexed fields
 - client, username
- Pattern search
 - `(substr(lower(query,1,1000) text_pattern_ops)`
- Generating search functions for users

Security and Monitoring

- Security model:
 - read-only access, one schema per customer
- `partition_creation` table
- `processed_logfiles` table

Example

pgBadger New Level

Tracing Application Session

Automation

Steps to set up logs loading

1. Create logging: create a new schema, RO user, monitoring tables, user functions
2. Create logging instance: create a new table for a specified database
3. Create log partitions: create a partition for a specified date
4. Start transferring log files to pgBadger server

```
call logs_meta.load_log_file(  
    'sweets',  
    'chocolate',  
    '2024-08-08',  
    'chocolate_1723094386')
```

**We have over 200 production
instances and everybody wants
logging!**

pgBadger New Level

Ultimate Automation Using Python

- pgbadger server: host, port, dbname
- client: host, port, dbname
- new: yes/no
- start time (last X minutes)
- run for specified time interval/run until stop
- New schema is created if not found
- New log table is created if not found
- Day partitions created as needed
- If the same log file is loaded, partition is dropped and recreated

By the Numbers

Disk usage and processing

- Log size: 2.2GB
- Logging time: 11.5 hours
- # rows: 3.3 M
- Total table size: 1 GB
- Load: real-time

Future work

- More standardized reports
- Unit tests
- Archiving strategy
- Wait events?!
